

# Benchmarking ICT use among General Practitioners in Europe 2007

## Country Profile: Cyprus

### Key findings: eHealth among GPs in Cyprus<sup>1</sup>

Cyprus has to be considered a weak average performer in terms of eHealth as it scores below the EU27 average with regard to most indicators included in the survey. This concerns both the availability of ICT infrastructure (computer, Internet) and the use of ICT for different eHealth-related purposes.

In terms of infrastructure, 69% of the Cypriot GP practices use a computer. 58% of the practices are connected to the Internet. These figures indicate that once a practice is equipped with a PC, it is very likely that it will connect to the Internet as well. Around one half of the GP practices that are connected to the Internet use a broadband connection. When compared to the other European Member States the figures mentioned above indicate that Cyprus has to be considered rather a laggard in terms of ICT infrastructure in GP practices.

#### ICT Infrastructure in Cypriote GP practices

**Base:** All GPs. **Indicators:** R4, C1, C2 (cf. annex for more information), % values. **Source:** empirica, Pilot on eHealth Indicators, 2007.

As shown in the diagram below Cyprus scores below the EU27 average for most of the eHealth applications under consideration in the survey. Cyprus displays its best eHealth performance in the area of patient data storage and use of a computer for consultation purposes. With regard to the storage

<sup>1</sup> **Disclaimer:** Neither the European Commission nor any person acting on behalf of the Commission is responsible for the use which might be made of the following information. The views expressed are those of the authors and do not necessarily reflect those of the European Commission. Nothing in this document implies or expresses a warranty of any kind. Results should be used only as guidelines as part of an overall strategy.

of administrative data, Cyprus comes very close to EU27 averages and with regard to the storage of the different data types Cyprus even attains the same level as the EU27 as a whole. Although only roughly half of the Cypriot GP practices store electronic medical patient data, those that do so use them to register a variety of different data types.

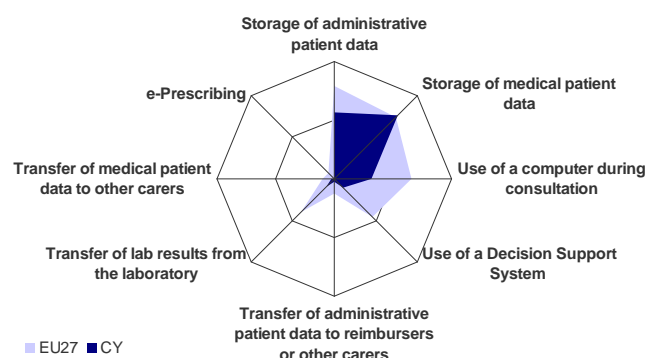

In Cyprus, computers are used in consultation with the patients only to a very limited extent (roughly 30% of the GP practices). This percentage lags far behind the EU27 average of 66%. The use of Decision Support Systems is even less common. They are used for either diagnosis or prescribing purposes in only 17% of Cypriot GP practices.

The transfer of individual patient data via Internet or dedicated networks has not yet arrived on the agenda of Cypriot GPs. Only 6% of Cypriot GP practices exchange administrative data either with other carers or with reimbursers via networked connections. The exchange of medical data via networked connections is equally little prevalent: only 3% of the GP practices participating in the survey reported having exchanged medical data with other care providers while 10% received results from laboratories this way.

ePrescribing is still not a reality in most European Member States. This holds true for Cyprus as well where none of GPs participating in the survey reported using ePrescribing.

The rather low level of ICT use in Cypriot GP practices can be explained to some extent by the fact that eHealth is a very new policy domain in Cyprus that has only been on the government's agenda since 2005.

#### eHealth Use by GPs in Cyprus

**Indicators:** Compound indicators of eHealth use (cf. annex for more information), % values. **Source:** empirica, Pilot on eHealth Indicators, 2007.

## ICT Infrastructure in GP Practices

An appropriate ICT infrastructure in the GP practice lays the ground for different eHealth use cases (such as storage of electronic medical and administrative patient data, its electronic exchange etc.). It is therefore the baseline from which a European GP can start his or her professional activities in the eHealth domain.

ICT infrastructure as understood here entails

- the availability of one or more computers in the practice;
- a connection with the Internet; and
- the availability of a broadband connection.

## Use of computers

In Cyprus only roughly 70% of GP practices are equipped with a computer. This places Cyprus in the small group of laggards, where less than 75% of the Practices are equipped with a computer. On the other side, 24 of the countries covered by the survey show an availability rate of more than 75%, a fact that clearly indicates that computers have arrived in EU GP practices. Computers are becoming more and more an essential and unquestioned part of practice fixtures.

In Cyprus therefore only around two-thirds of the GP practices fulfil the infrastructural prerequisite for the successful implementation of eHealth applications. One out of three GP practices is insufficiently equipped and therefore unable to take advantage of eHealth solutions.

### Use of Computers in GP Practices in Cyprus

Base: All GPs. Indicator: R4 (cf. annex for more information), % values. Source: empirica, Pilot on eHealth Indicators, 2007.

## Use of the Internet and broadband

In terms of Internet connectivity as a second prerequisite for eHealth applications that entail data transmissions and information retrieval, Cyprus has to be considered rather a laggard as well. 58% of Cypriot GP practices dispose of an Internet connection, as compared to 69% on average in the EU27. On the other hand it should be noted that in Cyprus the gap between computer use and Internet use is rather small as only 11% of the GP practices use a computer without using the Internet as well. When it comes to Internet connections, large differences between Member States persist. Cyprus holds a mid field position in a rather large group of countries where

less than 75% practices have Internet access. Internet use rates in Cyprus equal those attained in Germany, and stay very close to those reached by Maltese GP practices.

In Cyprus, broadband is not very common, it is used by only around one third of the GP practices. This figure is substantially below the EU average of 48% of broadband connections and puts Cyprus on a par with Lithuania, Poland and Portugal. In Cyprus, around one out of two practices that are connected to the Internet use broadband connections, the remaining half of the practices resort to different forms of access.

### Use of the Internet in GP Practices in Cyprus

Base: All GPs. Indicator: C1 (cf. annex for more information), % values. Source: empirica, Pilot on eHealth Indicators, 2007.

## Cypriote GP Practices Using a Broadband Connection

**Base:** All GPs. **Indicator:** C2 (cf. annex for more information), % values. **Source:** empirica, Pilot on eHealth Indicators, 2007.

All in all, the differences regarding bandwidth across the EU27 Member States remain high. Usage rates of broadband connections span from only 5% in Romania up to 93% in Finland.

### Use of eHealth Applications

With about 87% of European GP practices having a computer and about 69% being connected to the Internet, the question as to if and how this ICT infrastructure is used. The following sections deal with the use of ICT for different purposes in a GP practice's day-to-day business.

#### Electronic patient data storage

Electronic patient data storage is not yet very common in Cyprus. In comparison to the other EU Member States, Cyprus has to be regarded as one of the laggards as only around one half of the GP practices store at least one sort of individual medical patient data. Even lower usage rates are however attained in Latvia, Lithuania Romania, Poland, Malta and Greece. Otherwise, in all other European countries more than half of the GP practices store at least one type of electronic

patient data. In this context it should be brought to mind that one third of Cypriote GP practices do not have a computer that would enable them to store electronic patient information. Concerning the different data types, usage rates in Europe vary substantially, while mostly a common usage pattern emerges.

Cyprus is unique in that most GP practices that do store medical patient information at all, store not only one, but several types of patient data. Cyprus therefore scores at or above average for most types of medical patient data under observation. Diagnoses and medicamentations are the two data categories that are stored most often (in 93% and 90% of those Cypriote GP practices that use EHRs). Information on vital signs measurements, basic medical parameters and medical history are stored in over 80% of the Cypriote GP practices that use local EHRs. All other data types are stored in more than 65% of the practices. The only exception are radiological image which are stored in only around one third of the practices. Even this figure however corresponds roughly to European averages.

### Electronic Patient Storage in Cyprus: Storage of Different Types of Individual Patient Data by GPs storing electronic medical patient data

## Electronic exchange of patient data via the Internet or other dedicated networks

The electronic exchange of patient data via the Internet or other dedicated networks is not yet very common; neither in Cyprus, nor in Europe as whole. Only 10% of Cypriot GPs use network connections for the reception of analytical results from laboratories and only 3% of GPs exchange data with other care providers. These figures - that compare to 40% and 10% on average in the EU27 - place Cyprus at the tail end of the European countries.

Telemonitoring has not yet arrived on the scene neither in Cyprus nor in the EU as a whole. In Cyprus not even one of the practices uses it. This figure compares to the highest usage rate which is realised in Sweden. Even here, not more than 9% of the GPs report making use of telemonitoring. The

only other countries with a mentionable usage rate of telemonitoring are the Netherlands and Iceland, scoring 3% each.

A similar pattern can be discovered with regard to the exchange of medical patient data across borders. In this case the Netherlands shows the highest usage level with however only 5% of practices taking part in cross-border transmissions of medical data. Cyprus and Malta come in second with a score of 3% each.

The low level of trans-border data sharing may be explained by the fact that the health care jurisdiction is explicitly under the jurisdiction of the individual Member States. Due to the differing health care systems in EU Member States, it is unsurprising that, with only very few exceptions, planned treatment is provided principally in the country of residence.

### Electronic Exchange of Different Types of Medical Patient Data in Cyprus

	EU27	EU27+2	BE	BG	CZ	DK	DE	EE	EL	ES	FR	IE	IT	CY	LV	LT	LU	HU	MT	NL	AT	PL	PT	RO	SI	SK	FI	SE	UK	IS	NO

## ePrescribing

The only three EU Member States where ePrescribing is a reality are Denmark, Sweden and the Netherlands. Apart from this frontrunner group, only Iceland as a non-EU Member State shows an adoption level that rises above 5%.

In Cyprus however, as in most of the European countries, virtually no GP practice makes use of ePrescribing.

### Use of ePrescribing by GPs in Cyprus

Base: All GPs. Indicator: D1 (cf. annex for more information), % values. Source: empirica, Pilot on eHealth Indicators, 2007.

## Coded data entry

In Cyprus the distribution pattern of coded and uncoded data for the storage of electronic patient data is rather unusual. While in the EU on average a slight majority of GP practices use a mixed form of coded and uncoded data (45%), in Cyprus most GP practices (64%) that store patient data, chose to do so in un-coded form only. Solely coded data is used in only 10% of the Cypriot GP practices, as compared to 21% on average in the EU. A mix of both coded and uncoded data is

used by only 14% of the Cypriot GP practices. For the latter, a clear estimation of the coded/uncoded share is not possible.

Coded data entry in this context refers to the use of coding systems such as the ICD (the WHO's International Classification of Diseases) that allows to store a disease or diagnoses as a code rather than as a textual description. Only in a handful of countries the share of practices using solely coded data is above one third. Rather, most practices use a combination of coded and uncoded data.

### Use of data coding for the storage of electronic patient data by Cypriote GPs

	EU27	EU27+2	BE	BG	CZ	DK	DE	EE	EL	ES	FR	IE	IT	CY	LV	LT	LU	HU	MT	NL	AT	PL	PT	RO	SI	SK	FI	SE	UK	IS	NO

**Base:** GPs storing patient data. **Indicator:** A4 (cf. annex for more information), % values. **Source:** empirica, Pilot on eHealth Indicators, 2007.

### Exchange of administrative patient data

Data transfer via networks concerns not only medical data, but can also be used for administrative purposes, i.e. for data exchanges between the GP practice and reimbursers or other care providers.

Cyprus scores below the EU average of 10% for the exchange of administrative data with other carers which is used by only 3% of Cypriot GP practices. The use of networks in order to exchange administrative data with reimbursers is not widespread either: only 3% of Cypriot GPs communicate data via networks, as compared to 15% on average in the European Union Member States. This figure places Cyprus in

a rather large group of laggard countries, where less than 10% of GP practices routinely transfer administrative patient data. This group includes several Eastern European countries, some small Member States such as Cyprus and Malta, but also countries like Italy and Germany. When it comes to the exchange of administrative patient data in the EU27 member states, huge variations come into view: as regarding the exchange of administrative data with other care providers, shares differ between 0% (Latvia and Luxembourg) and 74% (Denmark). Rates for the exchange of administrative data with reimbursers also differ widely: from 0% (Latvia and Luxembourg) to 48% (Denmark).

### Exchange of Administrative Patient Data in Cyprus

	EU27	EU27+2	BE	BG	CZ	DK	DE	EE	EL	ES	FR	IE	IT	CY	LV	LT	LU	HU	MT	NL	AT	PL	PT	RO	SI	SK	FI	SE	UK	IS	NO

**Base:** All GPs. **Indicator:** D1 (cf. annex for more information), % values. **Source:** empirica, Pilot on eHealth Indicators, 2007.

### Data exchange and security

Data security is an important issue when sensitive, identifiable patient data is stored and transmitted electronically. There are a number of different techniques to make the handling of patient data secure, including password protection of the computer system and of transmitted files, encryption of transmitted files and e-mails as well as the use of e-signatures.

With relation to the use of security features Cypriot GP practices follow the general pattern found in the EU27. GP practices in Cyprus exhibit however use rates that are below the EU averages for all security methods under observation.

Password protected access is the most readily available form of data protection and therefore unsurprisingly the method the most widely used. 94% of GP practices in the EU27 have established a password protected access. In Cyprus 72% of the GP practices resort to password protected access. This translates to the lowest use rates of password protected access in Europe. The situation for the use of passwords for the protection of transmitted files is similar. This

security method is used by 57% of the GP practices in Europe, but only around 40% of the Cypriot GP practices.

Other than the case of password protection, both encryption and the use of electronic signatures require a dedicated infrastructure, which must be present at both ends. The higher effort required by these security techniques explains why they are used by a significantly lower percentage of European GP practices.

The encryption of transmitted files is a security feature that is used by around 40% of GP practices in the EU. In Cyprus only half as many GP practices, that is around one fifth, resort to this security technique.

The use of e-Signatures varies widely across Europe. However, on average only 19% of GP practices use e-Signatures. Cyprus scores slightly below average for this security feature as only 13% of Cypriot GP practices make use of this security feature.

All in all Cypriot GP practices display a very basic use of security techniques.

## GPs Use of Security Features in Cyprus

	EU27	EU27+2	BE	BG	CZ	DK	DE	EE	EL	ES	FR	IE	IT	CY	LV	LT	LU	HU	MT	NL	AT	PL	PT	RO	SI	SK	FI	SE	UK	IS	NO

**Base:** All GPs. **Indicator:** D4 (cf. annex for more information), % values. **Source:** empirica, Pilot on eHealth Indicators, 2007.

## Computer use in consultation

Apart from the storage and exchange of patient data, a computer can also be used in direct interaction with the patient, i.e. during the consultation in the practice. It can be used to display a patient's file to the practitioner, to provide supporting information when making treatment or medication decisions, but also for the explanation of medical issues to the patient, e.g. by means of a graph, photo or animation.

Cyprus heads a group of seven countries, where computers are used for consultation with the patients in one third or less of the GP practices. With only 32% of Cypriot GP practices using a computer for consultation, the country ranks well below the EU27 average of 66%. While roughly one out of two

Cypriot GP practices is equipped with a computer in the consultation room, only slightly more than half of those GPs that have a PC at their disposition actually use it for direct interactions with the patient.

These figures place Cyprus on a par with Malta, where both the availability and the use of a computer for consultation purposes are on a similar level.

When it comes to the use of a computer in consultation with the patients, a huge gap can be observed between frontrunners countries with more than 90% of computer use (Finland, United Kingdom, Estonia, the Netherlands and Denmark) and the countries following or lagging behind.

## Computer Use in Consultation with the Patient in Cyprus

**Base:** All GPs. **Indicator:** B2 (cf. annex for more information), % values. **Source:** empirica, Pilot on eHealth Indicators, 2007.

## Attitudes and Impacts

What role do ICTs play in the day-to-day work of a European General Practitioner? What is a GPs general attitude towards ICT and what facilitators and barriers towards a wider uptake of eHealth do they perceive? What are the impacts of eHealth?

GPs in Cyprus are quite positive when it comes to the question whether ICT really and tangibly improves the quality of health care services. They are even more positive than many of their other European counterparts. When looking at the other countries it is interesting to see that in none of the 29 countries under observation a negative attitude is prevalent.

This positive attitude seems to have nothing to do with whether a country is more of an eHealth laggard or a frontrunner. Those countries displaying an only moderately positive attitude (such as Germany, France and Austria) are all average eHealth performers. At the same time, GPs using eHealth and practising in countries that can be considered eHealth laggards (e.g. Greece, Cyprus or Romania) show an attitude that is more positive than the EU average. Since difference between the countries in relation to the perception of facilitators and barriers as well as eHealth impacts are only small, the following analysis focuses on the EU average results, reporting national deviations where they occur.

## GPs General Attitude Towards ICT Use in Health Care in Cyprus

**Base:** GPs using computers. **Indicator:** F1 (cf. annex for more information), attitude scores. **Source:** empirica, Pilot on eHealth Indicators, 2007.

### Perception of facilitators and barriers

Among the factors that could facilitate the diffusion of eHealth, most European GPs would prefer if the issue were included in the curricula of medical education. The second most important facilitating factor is related to IT training provided to the GPs themselves. Thirdly, a better networking of all health actors in order to share clinical information is also regarded as beneficial by a majority of GPs.

The Cypriot GPs on the contrary agree strongly that IT and software issues should be included in the general medical education. As regards the electronic exchange of clinical information, GPs in Germany, Poland, Iceland and Norway are less positive about this than the European average, but still mostly agree to a certain extent. On the other hand, Greek, Lithuanian and Romanian GPs are considerably more positive on this issue than their European peers.

are however considerably more critical about both issues. A lack of IT support is seen as a barrier to eHealth — at least to a certain extent — by a majority. Costs are perceived as a barrier to eHealth for a noticeably larger number of GPs in these countries than in the EU average. In Cyprus, cost is not seen as an important factor, but there is a significant share of GPs who would welcome enhanced maintenance support for their practice ICT systems.

Noticeable deviations from these patterns can also be found in Greece, Spain and Ireland, here a majority of GPs somewhat agrees to the statement that a lack of IT support has a negative impact on eHealth use.

### Perception of impacts

In Cyprus the perception of eHealth impacts all in all resembles the general pattern found in the EU27.

The general impact perceptions show quite a clear pattern: the GPs are most positive about the administrative impacts of ICT use in health care, namely impacts in relation to their personal or practice staff working processes.

When it comes to patient-related or medical impacts a more ambivalent picture emerges. For every GP being positive about those impacts, there is at least one other GP not perceiving any benefit. This is for instance the case in relation to impact on the quality of diagnosis and treatment decisions: here about half of the GPs see positive impacts as compared to the other half seeing no impacts. In case of doctor-patient relationship and the workload of the support staff — including nurses etc. — between 16% and 25% say that the impacts are actually negative, i.e. that the relationship to the patient has deteriorated or that the workload of the support staff has gone up. The latter could indicate that the brunt of additional effort created by ICT use is not borne by the GP but by the other workers in the practice. This is also not contradicted by the perceived improvement of working processes. For the practitioner this may be due to the fact that they are not burdened with additional work generated by ICT and for the rest of the practice staff improved working processes might mean that an overall increased workload is simply handled more efficiently. In Cyprus only 11 % of the GPs are convinced that their staff's workload has gone up due to the introduction of IT solutions, a majority sees no change and one third attributes a decrease of the workload to the introduction of IT solutions.

## GPs Perception of Facilitators and Barriers in the EU27

**Base:** GPs using computers. **Indicator:** F1b (cf. annex for more information), agreement scores. **Source:** empirica, Pilot on eHealth Indicators, 2007.

In relation to IT training for GPs, practitioners in Denmark, Germany, Hungary and the Netherlands see this as a less important issue. A majority of Cypriot practitioners however agrees that more IT training would be useful in order to enhance the use of eHealth applications.

When it comes to potential eHealth barriers, most practitioners seem — on average — to consider neither a lack of IT support nor cost as a factor that seriously hampers their use of ICT. In some of the Eastern European Member States, GPs

In Europe, on average around one-third of the practitioners state that the scope of services offered by the practice actually increased due to the use of IT systems and software. In Cyprus the share of GPs being convinced that the introduction of IT helped them to increase the scope of services offered by their practice goes up to over 50% of the GPs. It can be assumed that for those GPs IT is not just a tool to make existing — e.g. administrative — processes more efficient but to broaden the range of their activities.

The last two areas under observation here are the impact on the number of patients treated as well as on the number of

patients coming to the practice. In Cyprus around one third of the GPs expressed their conviction that the use of IT increased the average number of patients they could help in one day. An increase in the absolute number of patients coming to the practice however was only reported by 17% of the GPs. Most GPs therefore did not experience any influence of the use of eHealth applications on the number of their patients. This goes in line with the general impression by European GPs, most of whom did not report any changes in the number of patients coming to the practice or being treated per day.

### GPs Perception of eHealth Impacts in the EU27

**Base** Users of electronic records, or access to health networks, or electronic patient data exchange. **Indicator:** F1 (cf. annex for more information), attitude scores. **Source:** empirica, Pilot on eHealth Indicators, 2007.

### Making Sense of eHealth Use Patterns in the Member States

In terms of infrastructure, Cyprus shows a very basic level of equipment as only 69% of GP practices own a computer, 58% are connected to the Internet and 32% have access to a broadband Internet connection.

Today the use of ICT by Cypriot GPs is on a rather low level. Cyprus displays its best eHealth performance in the area of patient data storage (57% of the GPs) and use of a computer for consultation purposes (32%). With regard to the storage of administrative data, Cyprus comes very close to EU27 averages and when it comes to the storage of the different medical data types Cyprus even attains the same level as the EU27 as a whole. Decision Support Systems however are not yet very common in Cyprus.

The government strategy for eHealth is a new item on the political agenda of Cyprus. Since the country's eHealth infrastructure is still on a comparatively low level the government aims to increase the computer use in primary care and to optimize medical procedures by standardization of medical terminology and classification and coding of diagnoses. Other applications such as a national health monitoring system and the introduction of an EHR are also part of the eHealth strategy in Cyprus.

#### Cyprus policy strategies with eHealth relevance

Cyprus government strategy for eHealth

The Cypriot government is currently making some efforts to implement a nationwide health information system. In 2004 the government commissioned the development of software applications to provide an integrated Health care Information System (HCIS), which was two years later accepted and ready for use. The system includes many applications and modules to increase the quality and efficiency of procedures, working paperless and providing remote medical services. The HCIS currently focuses on hospitals and outpatient departments but there are plans to also open it up to General Practitioners and to allow them to access hospital patient record systems. The system is already implemented in some hospitals and will be completed in 2010 so that all hospitals and medical centres will have access to it.

## ANNEXES

### The Pilot on eHealth Indicators Study

The “Pilot on eHealth Indicators” study was carried out by empirica in association with IPSOS on behalf of the European Commission, Information Society and Media Directorate-General. The purpose of the present study was to measure the availability and use of ICT by primary care physicians in the EU27 and EEA countries, achieved by means of a survey of primary care physicians on their use of ICT for communicating with patients and between primary and secondary care and other eHealth agencies. Through this survey up-to-date information and data on eHealth developments was obtained. In addition 29 Country Briefs for each of the Member States, Norway and Iceland were developed.

### The Final Report

The Final Report of the study puts together all the results from the General Practitioner survey, including many indicators not used for this Country Profile. It also contains an extensive analysis of data, drawing a coherent picture of ICT use among General Practitioners in Europe.

#### Indicators used

The Final Report contains an indicator annex listing all statistical indicators covered by the survey, including those used for this Country Profile. The indicator codes used in the footnotes of the graphs and tables (e.g. B2, C1 etc.) can be used to identify the corresponding indicator in the list.

### Methodology Report

#### The survey

Data used for this Country Profile were collected by means of a survey of primary care physicians and their use of ICT with patients and between primary and secondary care and other health agencies.

The survey was carried out in all 27 Member States of the European Union and in Norway and Iceland. The fieldwork took place in the third quarter of 2007. It was coordinated by the German Ipsos branch Ipsos GmbH, Mölln and was conducted in cooperation with local partner institutes.

The survey was carried out in form of Computer-Aided Telephone Interviewing (C.A.T.I.). Exception is Malta where face-to-face interviews using P.A.P.I. methodology (Paper-and-Pencil Interviews) were conducted. In Sweden CATI interviews were used, until the sample was exhausted due to the specificities of the Swedish health system. The remaining interviews were accomplished through Computer-Aided Web-Interviews.

#### Universe/ Target Person and Sampling

The universe consisted of all General Practitioners in the respective countries. From the universe a random sample of practices / institutions with a quota on region and - where possible - private practice / institution was drawn. The target respondent within the practice / institution was selected via a random procedure if more than one GP were present. In total, 6,789 interviews were achieved. The sampling was done in a decentralised way and by each of the partner institutes.

## Number of Interviews Conducted

	Country	Interviews
BE	Belgium	318
BG	Bulgaria	206
CZ	Czech Republic	304
DK	France	261
DE	Germany	253
EE	Estonia	150
EL	Greece	315
ES	Spain	325
FR	France	302
IE	Ireland	206
IT	Italy	290
CY	Cyprus	72
LV	Latvia	177
LT	Lithuania	263
LU	Luxembourg	63
HU	Hungary	251
MT	Malta	92
NL	Netherlands	258
AT	Austria	299
PL	Poland	351
PT	Portugal	284
RO	Romania	304
SI	Slovenia	103
SK	Slovakia	261
FI	Finland	250
SE	Sweden	267
UK	United Kingdom	257
IS	Iceland	103
NO	Norway	204
	<b>Total</b>	<b>6.789</b>

#### Weighting schemes

After the fieldwork, weighting coefficients were computed giving each country a weight according to its population size in the respective group of countries: EU27+2 (for all 29 countries surveyed), EU27 (all EU Member States).
